はじめに

Drupal で Web デザインを開発する方法を基礎から学ぶ勉強会です。

Drupal 7 から始めて、Drupal 8 がリリースされた段階から、Drupal 8 も学びます。また、オリジナルのデザインテンプレートを作るほかに、良く使われている Drupal のベーステーマ、Omage、Zen、Adaptivethemes、Bootstrap など学びます。

Drupal 8 のデザインの作り方、管理、

Theming Drupal 8 <https://www.drupal.org/theme-guide/8>

Theming Drupal 8

[View](#) [Edit](#) [Revisions](#)

*Last updated November 20, 2015. Created on February 3, 2013.
Edited by [guitarbound2015](#), [HongPong](#), [sqndr](#), [wusel](#). You can [edit this page](#), too.*

This guide is about creating themes for Drupal 8.

Quite significant [changes were introduced in the theme system between Drupal 8 and 7](#). This guide contains information that applies to Drupal 8 and refers sometimes to Drupal 7 in order to explain new concepts and approaches.

Outside drupal.org other theming guides can be found, such as [sqndr's excellent Drupal 8 theming guide](#).

PHPTemplate has been discontinued for theming in Drupal 8; the [Twig markup language is used instead](#). This will make Drupal 8 themes much more secure because PHP calls will no longer exist in theme files. This will also make theming easier to understand for non-programmers.

For a collection of useful materials for themers, see [Theming and Front End Development with Drupal](#).

Defining a theme with an .info.yml file

Defining a theme with an .info.yml file

[View](#) [Edit](#) [Revisions](#)

Last updated December 2, 2015. Created on October 3, 2014.

Edited by [Cottser](#), [wesruv](#), [davidhernandez](#), [JohnAlbin](#). You can [edit this page](#), too.

To create a Drupal 8 theme you need to first create a THEMENAME.info.yml file that provides meta-data about your theme to Drupal. This is similar to how modules and installation profiles are being defined, and as such it is important to set the 'type' key in the .info.yml file to 'theme' in order to differentiate it.

This page provides an example THEMENAME.info.yml file, and an overview of the information that the file can contain.

Create an .info.yml file

You create the .info.yml file in the root of your [theme folder](#). The folder should have the same name as the .info.yml file. So if your theme is named "Fluffiness" then the folder is named "fluffiness/" and the .info.yml file is named "fluffiness/fluffiness.info.yml". If the file is present your theme will be visible in your website at Manage > Appearance (<http://example.com/admin/appearance>).

Theme folder structure

Theme folder structure

[View](#) [Edit](#) [Revisions](#)

Last updated November 13, 2015. Created on October 3, 2014.

Edited by [eojthebrave](#), [Sumit kumar](#), [joelpittet](#), [sphism](#). You can [edit this page](#), too.

A theme is a collection of files that define the presentation layer. [You can also create one or more "sub-themes"](#) or variations on a theme. Only the .info.yml file is required, but most themes and sub-themes will use other files as well. This page lists the files and folders that are found in a typical theme or sub-theme.

Location of themes

You must place themes in the "themes" folder of your Drupal installation. Note that Drupal core themes such as Bartik and Seven are located in the core/themes folder of your installation.

It is good practice to place the [contributed themes](#) in a sub folder named "contrib" and your own themes in a folder named "custom".

Twig in Drupal 8

Twig in Drupal 8

[View](#) [Edit](#) [Revisions](#)

*Last updated October 19, 2014. Created on October 3, 2014.
Edited by [batigolix](#), [jOksanen](#), [LoMo](#). You can [edit this page](#), too.*

Twig is a template engine for PHP and it is part of the [Symfony2](#) framework.

In Drupal 8 Twig replaces PHPTemplate as the default templating engine. One of the results of this change is that all of the `theme_*` functions and PHPTemplate based `*.tpl.php` files have been replaced in by `*.html.twig` template files.

Locating Template Files with Debugging

Locating Template Files with Debugging

[View](#) [Edit](#) [Revisions](#)

*Last updated November 2, 2015. Created on October 17, 2014.
Edited by [Cottser](#), [chrisfree](#), [japo32](#), [brianperry](#). You can [edit this page](#), too.*

If you want to know which template is generating the markup for a particular element, you can use Twig's built in `debug` option. This option will render HTML comments alongside your rendered output that include the theme hooks in use, suggested template filenames, as well as denoting the exact Twig file used to render a particular section of your markup.

You enable Twig debugging in `sites/default/services.yml` by setting `debug: true` under the `twig.config` section. For full instructions on Twig debugging, see [Debugging compiled Twig Templates](#).

Adding Regions to a Theme

Adding Regions to a Theme

[View](#) [Edit](#) [Revisions](#)

Last updated November 10, 2015. Created on April 11, 2015.

Edited by [ashish_nirmohi](#), [bruvers](#), [squidgle](#), [autopoietic](#). You can [edit this page](#), too.

Adding regions to a theme requires:

- Adding region meta-data to your THEMENAME.info.yml file
- Editing your page.html.twig file and printing the new regions

Adding Regions to Your Info File

Start by declaring any new regions in your THEMENAME.info.yml file. Regions are declared as children of the `regions` key like so:

```
# Regions
regions:
  header: 'Header'
  content: 'Content'
  footer: 'Footer'
```

Adding stylesheets (CSS) and JavaScript (JS) to a Drupal 8 theme

Adding stylesheets (CSS) and JavaScript (JS) to a Drupal 8 theme

[View](#) [Edit](#) [Revisions](#)

Last updated December 4, 2015. Created on March 12, 2014.

Edited by [Wim Leers](#), [Paritoshik Paul](#), [thamas](#), [ashish_nirmohi](#). You can [edit this page](#), too.

In Drupal 8, stylesheets (CSS) and JavaScript (JS) are loaded through the same system for modules (code) and themes, for everything: [asset libraries](#).

Drupal uses a high-level principle: assets (CSS or JS) are still only loaded if you tell Drupal it should load them. Drupal does not load all assets (CSS/JS) on all pages, because this is bad for front-end performance.

Differences compared to Drupal 7

There are four important differences compared to Drupal 7 for themers:

1. We no longer have a `THEME.info` file, but a `THEME.info.yml` file, but it still contains the same data.
2. The `stylesheets` property (for adding CSS assets) in `THEME.info.yml` files no longer exists, because we use only libraries now.
3. The `scripts` property (for adding JS assets) in `THEME.info.yml` files no longer exists, because

Bootstrap ベースのデザインテンプレートです

Integrity

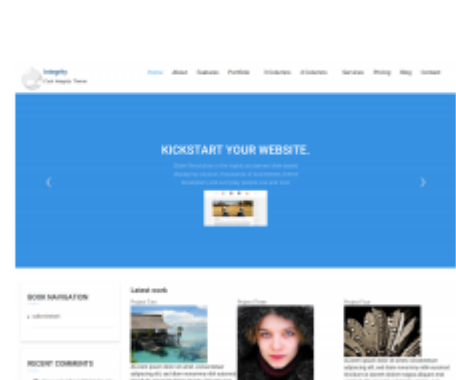

[View](#) [Version control](#) [Revisions](#)

Posted by [leopathu](#) on November 19, 2015 at 2:12pm

Integrity is a Drupal 8 bootstrap multipurpose theme, Developed for your Business, Corporate, Portfolio. Its easy to use and fully customize.

Features :

- Based on Bootstrap 3
- 100 % Responsive
- 1/2/3 Column layout support
- Font Awesome
- 17 Regions

Bootstrap 3 for Drupal モジュール

Bootstrap

Features

- [jsDelivr](#) CDN for "out-of-the-box" styling and faster page load times.
- [Bootswatch](#) theme support, if using the CDN.
- Glyphicons support via [Icon API](#).
- Extensive integration and template/preprocessor overrides for most of the [Bootstrap Framework](#) CSS, Components and JavaScript
- Theme settings to further enhance the Drupal Bootstrap integration:
 - [Breadcrumbs](#)
 - [Navbar](#)
 - [Popovers](#)
 - [Tooltips](#)
 - [Wells](#) (per region)

The [Panels module](#) allows a site administrator to create customized layouts for multiple uses. At its core it is a drag and drop content manager that lets you visually design a layout and place content within that layout.

Panels 3 is the most recent version of [Panels](#), and is a significant advance over Panels 2, although its user interface is similar.

Panels 3 is documented in detail and used for Drupal 7 and 8.

Overview

The [Pane module](#) provides translatable custom panels panes with body and optional title, stored as variables.

- Panes exposed as both panels panes and blocks
- Each pane has a body and optional title
- Translatable via i18n's i18n_variable module
- Contextual link to quickly edit or translate
- Stored as variables for easy ctools/features export

For an overview of the module, see [Introducing the Pane Module](#).

Tutorial

This demo requires the Panels, Page Manager (page_manager), and Features modules. (Page Manager is in CTools).

Let's create a home page in panels that you can deploy easily and your client can edit, without overriding Features. This assumes you use Features to deploy and manage your site, pushing config changes via code in git. A common problem with this workflow is that site admins change text, which causes features to be flagged as overridden. Using pane, you can deploy pages in code but allow text to be changed freely.

1. Create a new pane
